

**A METHOD FOR CONTROLLING A COMPUTER USING AN EMBEDDED  
UNIQUE CODE IN THE CONTENT OF CD MEDIA**

**ABSTRACT OF THE DISCLOSURE**

5           A method for allowing a user PC (1702) to be controlled in order to effect a  
connection between the user PC (1702) and a destination node (1706) on a network  
(306). This is facilitated through an audio source (1700) wherein compact disk recording  
media has embedded therein an audio signal. When the compact disk recording media is  
played, the audio signal is extracted by an audio extractor (1600) and transmitted to the  
10   user PC, and detected by a program running in the background of the user PC (1702).  
Once the audible tone is detected, a web browser is launched and the tone or decoded  
product identifier information associated with the tone is transmitted to an ARS (308) on  
the network (306). The ARS (308) then compares the information received from the user  
PC (1702) using information from a relational database (1704). The relational database  
15   (1704) contains routing information for various destination nodes (1706) on the network.  
When a match occurs, the matching information is then forwarded back to the user PC  
(1702) and this is utilized to route the user PC (1702) to the particular destination node  
(1706) corresponding to the audible tone for the processing of information received  
therefrom.
